

ABSTRACT

[0031] A method and system for identifying the physical location of computing devices. Each computing device has an identifying device that is activated when a user wishes to locate that device. The identifying device may be attached to or an integrated part of the computing device. The identifying device alerts the user by emitting light, sound, odor, or projecting a physical object. The identifying device may also alert the user with a pattern unique to the computing device. Once the user is alerted by the identifying device the user can physically locate the computing device.
